The sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. cDNA Library Preparation: M.B. Soares Lab Clone distribution:
clones will be available through Research Genetics (www.resgen.com)
The following repetitive elements were found in this cDNA sequence:
73-206, >RSIME1#SINE/B4(B5)

DNA was purified from a crude nuclear prepusing Brassica oleracea TO1000DH3 buds provided by Thosmas Osborn at the University of Wisconsin. Genomic DNA was provided by Pablo Rabinowicz (CSHL) and the shotgun library prepared at Washington University Genome Sequencing Center."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                    The clone sequenced to the left is RP11-401C13, 2000 bp overlap; the clone sequenced to the right is RP11-574017, 2000 bp overlap. Actual end of this clone is at base position 48999 of RP11-574017.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Waterston, R.H.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) variant protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by deletion of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-Adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CMD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Snapir A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene (I)-(III) by detecting a polymorphic site, comprising; (a) obtaining a sample having a polymoleotide encoding an alpha-2B, alpha2A or alpha2C or fragment or complement of; and (b) detecting a polymorphic site comprising nucleotide positions 901-909 of (I), a site comprising cytosine or guanine at position 753 of (IIV) or a site comprising (A) (999geggggcg) or (B) (999geggetgag) at positions 961-972 of (III). The method may be used for genotyping an alpha2B, alpha2A or alpha2C receptor gene and further used to determine whether an individual is at increased risk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a polymorphic site which correlate to disease selected from cardiovascular disease, central nervous system disease and combinations of these. In addition the technique may be used to market a comprising detecting a polymorphic site which correlate to disease selected from cardiovascular disease, central nervous system disease and combinations of these. In
                                                                                                                                                                                                                                                                                                                                                                                                                                                          addition, the technique may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, norepinephrine, clonidine, oxymetazoline, guanabenz, UK14304, BHT933 and combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC 239, rauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlated to adenylyl cyclase, MAP kinase activity, phosphorylation or inositol phosphate levels). The present sequence is that of the third intracellular loop of the human alpha-2BAR variant, the sequence is deleted for a 9 nucleotide polymorphic site found at nucleotides 901-909 of the wildtype gene (AAI99905).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene useful for determining whether an individual is at increased risk of developing a disease associated with the corresponding receptor comprises detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the anthypertensive effect of compounds. The present sequence is human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of catecholamines norepinephrine and epinephrine. An antagonist of vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries and a disease involving as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as Prinzmetal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in gene therapy.

                                                                                                                                                                                                                                                                                                                               CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; CC (a) obtaining a sample having a polymorphic site, comprising; CC (b) detecting a polymorphic site comprising apolymorphic polymorphic site comprising of (I), a site comprising cytosine or guanine at positions 901-909 (CC (b) detecting a polymorphic site comprising nucleotide positions 901-909 (CC or a site comprising (Ytosine or guanine at position 753 of (IIV) (CC positions 961-972 of (III). The method may be used for genotyping an expectation yell-972 of (III). The method may be used for genotyping an comprising (A) (9999099900) or (B) (9999090909) at (CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine comprising the alpha2B, alpha2A or alpha2 comprising detecting a cC disease, central nervous system disease and combinations of these. In cC disease, central nervous system disease and combinations of these. In cC disease, central nervous system disease and combinations of these. In cC disease, central nervous system disease and combinations of these. In cC disease, central nervous system disease and combinations of these. In cC disease, central nervous system disease and combinations of these. In cC disease, by detecting the polymorphic site of c.g. epinephrine, clonidine, oxymetazoline, guanabenz, UK14304, BH7933 and cC an alpha2B, alpha2A, or alpha2C agonist (e.g. vohimbine, prazosin, ARC 239, cc combinations of these) by detecting the polymorphic site and correlating the site to a cryolase, MAP kinase activity, phosphorylation or inosical phosphate (CC levels). The present sequence is that of the third intracellular loop of the human alpha-2BAR (GenBank Accession AF009500), the sequence includes a pucleotide polymorphic site an uncleotides 901-909, absent in the cCC alpha-2BAR variant (AA199906).

                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human

                                                         The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in the diagnosis and treatment of cancer and immunopathology and neuropathology.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Combination of polynucleotide probes, useful as array elements in microarray for monitoring the expression of a number of target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; probe; ss; array element; Parkinson's disease; signalling pathway population; cancer; adenocarcinoma; leukaemia; immunopathy; AIDS; asthma; neuropathy; Alzheimer's disease; micro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A genomic DNA clone (AAT59499) codes for human alpha-2B adrenergic receptor (AAM1804), a member of the rhodopsin-like signal transducer family. It was isolated from a human spleen genomic library in the lambda vector Charon 28 by screening with a 1.6 kb fragment of the human 5-hydroxytryptamine receptor gene. Plasmid pNGC-alpha-2B comprising DNA encoding the alpha-2B adrenoceptor is deposited as ATCC 68144. Vectors have been adapted to allow prodn. of alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk-cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of such cells can used in novel methods to identify drugs which specifically interact with, and bind to, the

                                                                                                                                    New isolated antigenic peptides e.g., for G (GPCR), useful for diagnosing and designing conditions in which GPCRs are involved, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regeneration-related disease; AIDS; cancer; immunological-related cell proliferative disease; autoimmune disease; Alzhelmer's disease; atherosclerosis; infection; osteoarthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; pain; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea;
                                                                                                                                                                                                                                                                                                                                                   Burmer GC,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              forensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, CDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                               19-DEC-2000; 2000US-257144P

CC (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino CC acids. Also described: (1) an assay for the detection of a particular CC grotein-coupled receptor (GPCR) or a candidate polypeptide in a sample; CC and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (1) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting antibody against a particular GPCR, and in the production of specific CC antibodies. The peptides and antibodies are also useful for detecting the CC GPCRs and antibodies are also useful for detecting the CC GPCRs and antibodies are useful for detecting the CC greatening immune-related diseases, growth-related cell proliferative CC treating immune-related diseases, growth-related cell proliferative diseases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease, cell cell seases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease, of the control of the protection of the present invention, which are used in the code of inflammation, schizophrenia, dementia, mental retardation, memory content of the control of the present invention, which are used in the cc gramplification of the present invention, which are used in the cc gramplification of the present invention.

```
CC comprising a sequence capable of hybridising under stringent conditions CC comprising a sequence selected from any one of 999 sequences (ABN99231). CC given in the specification or its fragment. A polypeptide (II) encoded by CC (II), a transgenic plant (III) comprising an exogenous nucleic acid, is cC useful in identifying homologous or related genes, in producing compositions that modulate the expression or function of its encoded CC useful in identifying homologous or related genes, in producing CC compositions that modulate the expression or function of its encoded CC protein, mapping functional regions of the protein and in studying secreening assays of various plant strains to determine the strains that CC are best capable of withstanding a particularly plant cells. (I) is also useful in Screening assays of various plant strains to determine the strains that CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC pathways. The screened agents are useful in improved methods of treating crops to programs to identify agents that mimic or enhance the action of tolerance of enhance their tolerance to environmental stress. (I) is also useful in a local content to which cc expression of proteins of interest, for establishing the extent to which cc elucidation content function of the manual for screening compounds to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Arabidopsis thaliana nucleic acid for identifying homologous genes, producing compositions that modulate the expression or function of its encoded protein, and mapping functional regions of protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gorlach J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   variants of clone 13 (AAT48438), which codes for pCL13 (AAW10662), a novel TGF-beta-like cytokine whose activities include immunosuppression, down-regulation of leucocyte extravasation and motility, promotion of cell differentiation and inhibition of proliferation. The clones were obtd. from a foetal lung library using a portion of the coding region of clone 13 (see also AAT48438) using a portion of the coding region of clone 13 (see also AAT48438) probe. They show substantial variation in the 5' untranslated region but following statements.
                                                                                                                                             pCL13; clone 13; transforming growth factor-beta; TGF-beta; immunosuppressive; cell differentiation; antiproliferative; wound healing; vulnerary; ischaemic injury; inflammation; cautoimmune disease; fibrotic disease; diagnosis; gene thera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           region but only minor differences in the coding region. Translatucoding regions are given in AAW10666-73. While the variants may limportant in e.g. transcriptional reglation they are untranslated and hence cannot affect bloactivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid encoding pCL13, new TGF-beta family member has immunosuppressant, cell differentiation promoting and anti-proliferative activities, for treatment of wounds, ischaemic

                                                                                                                                                                                                                                                     cDNA clones b2, h1, u2, f1, a1, b1, d2 and dd2 (AAT48442-49) are variants of clone 13 (AAT48438), which codes for pCL13 (AAM10662), a novel TGF-beta-like cytokine whose activities include immunosuppression, down-regulation of leucocyte extravasation and motility, promotion of cell differentiation and inhibition of proliferation. The clones were obtd. from a foetal lung library using a portion of the coding region of clone 13 (see also AAT48438) as probe. They show substantial variation in the 5' untranslated region but only minor differences in the coding region. Translated coding regions are given in AAM10666-73. While the variants may be important in e.g. transcriptional reglation they are untranslated and hence cannot affect bioactivity.
